psd file replacements, a slightly .pae mod, a few minor fixes and a handful of minor .xml files and other edits. This is a major update, especially if you're using .psd files in your mod. Happy Synth Modding! A: In order to answer this question you need to explain where your "psd" files are located, because not all of them are in /Documents/ on the Mac. The "Path" directory where your "psd" files are located depends on your current working directory. You can see the working directory by pressing the "up" and "down" keys on the keyboard to display the "folder stack". For instance, my working directory is /Users/dwight/Dropbox/Synth/. That means that when I open up the "Kaleidoscope" folder (where my "psd" files are located) on the Finder, the location will be "/Users/dwight/Dropbox/Synth/Kaleidoscope". When you're inside the "Kaleidoscope" folder, you can use the "up" and "down" keyboard keys to change the working directory. If you're having trouble locating your "psd" files, try opening the "Kaleidoscope" folder, then go to the "documents" folder and look for a file called "Kaleidoscope.psd". If

you're still having trouble, post a screenshot of the "path" directory showing the full file path of the file that you're having trouble locating. There is a quick fix for this. All you have to do is create a new PSD file and drag the existing PSD into that new file. Here is an example from the actual GitHub repo: Sooo, if you are like me, a simple Google search of "psd file rename" will bring up thousands of results. Here is my selection of methods. The ones that I like the most are the ones that do not require any programming or scripting. The above method works but would require you to manually rename each and every PSD file. This would require the installation of the commercial app called "PicMonkey". This method requires the scripting language of your choice to rename the files automatically. I use Python but you can also use Ruby or Perl or any number of scripting languages. This is the 82157476af
